### PRELIMINARY AMENDMENT

Assistant Commissioner for Patents Washington, D.C. 20231

Sir:

With regard to the above-identified application filed concurrently herewith, please amend the following:

## In the Claims:

Please enter the following amended claims:

- 3. (Amended) A composition in accordance with claim 1 characterised in that said antiperspirant salt is a zirconium salt complexed with aluminum salts having coordinated or bound water.
- 4. (Amended) A composition in accordance with claim 1 characterised in that said antiperspirant salt is present in the aqueous phase at from about 1 to about 60%.

- 6. (Amended) A composition in accordance with claim 1 characterised in that said aqueous phase further comprises a buffer, a glycol, a sugar, a cyclodextrin, a preservative, an antimicrobial, a chelating agent, a water-soluble polymer, an anticholinergic, a monovalent salt, a divalent salt, a trivalent salt, fragrances or mixtures thereof.
- 7. (Amended) A composition in accordance with claim 1 cit said aqueous phase is present at about 1% to about 60%, more preferably at 5% to 30%, and most preferably at 10 to 25%.
- 8. (Amended) A composition in accordance with claim 1 characterised in that said cosmetic oil comprises esters, ethers, long chain alcohols, or ethoxylated alcohols, hydrocarbons, fatty acids, monoglycerides, diglycerides triglycerides, fragrances and volatile or non-volatile silicone fluids, and cholesterol.
- 10. (Amended) A composition in accordance with claim 8 characterised in that said non-volatile silicone is phenyl tris(trimethylsiloxy)silane.
- 13. (Amended) A composition in accordance with claim 1 characterised in that the cationic quaternary ammonium surfactant has the following structure:

$$/-(CH_2)_x-CH_3$$
 $R-CO-NH-(CH_2)_n-N^+-(CH_2)_z-CH_3$ 
 $A-(CH_2)_z-CH_3$ 

wherein n is one to six.

x is zero to three

y is zero to three

z is zero to three

with the proviso that  $x+y+z \le 6$ 

A is any physiologically acceptable counter ion which does not adversely affect the composition, and more specifically A can be selected from the group consisting of chloride, bromide, ethosulfate, methyl sulfate, lactate, acetate, nitrate or sulfate.

Where R is a ricinoleic derivative:

CH<sub>3</sub> (CH<sub>2</sub>) <sub>5</sub>CH(OH) CH<sub>2</sub>-CH=CH- (CH<sub>2</sub>)<sub>7-</sub>

Or mixtures thereof.

15. (Amended) A composition in accordance with claim 1 characterised in that said cationic quaternary ammonium surfactant is present at 0.1% to 30%, more preferably at 1% to 30%, most preferably at 2% to 15%.

#### **REMARKS**

The present amendment is submitted to eliminate multiple dependencies and to correct minor typographical errors. The amendments were not intended to and should not be construed to have been made for any reasons related to patentability of the claims.

Attached hereto is a marked-up version of the changes made to the claims by the current amendment. The attachment is captioned "Version with Markings to Show Changes Made".

Respectfully submitted,

## ANTIPERSPIRANT COMPOSITIONS COMPRISING MICROEMULSIONS

#### 5 Field of the Invention

This invention is related to microemulsions that contain cosmetically active ingredients. In a preferred embodiment, this invention is related to antiperspirant salt-containing microemulsions that are stable, clear liquids and are easy and inexpensive to produce.

#### Background of the Invention

15

20

25

30

10

The microemulsions of the present invention contain water. Microemulsions of the present invention are transparent or translucent, optically isotropic and thermodynamically stable mixtures of oil and water stabilized by surfactants and perhaps co-surfactants. particle size of the dispersed phase of a microemulsion is about 100 to about 2000 angstroms, more preferably are about 100 to about 1000 angstroms. They can form spontaneously or with a little energy. Therefore they are simple to prepare and are not process dependent i.e. the order of addition of starting materials or speed / type of mixing is not critical to the preparation of the microemulsions. It would be desirable to formulate antiperspirant compositions using microemulsions because microemulsions are easy and inexpensive to process and can be inherently clear without

PCT/EP00/09144 WO 01/24766

- 2 -

requiring refractive index matching of the aqueous and nonaqueous phases.

Microemulsions have attracted considerable technological and scientific interest. Water-in-oil (w/o) 5 microemulsions containing water, an ionic surfactant, a cosurfactant and oil are the most investigated. The ionic surfactant- containing microemulsions usually exhibit stability over a large range of temperature. . inorganic salts are added, the minimum surfactant level to form water-in-oil microemulsions will increase. As the hydrocarbon oil chain length increases, the solubilization of aqueous phase into the oil phase decreases, while the liquid crystal area increases. Nonionic surfactantcontaining water-in-oil microemulsions require a large amount of surfactant as well. Unfortunately, nonionic surfactant-containing microemulsions commonly exhibit a small temperature range of stability

10

15

20

30

Microemulsions exist in the following forms: as waterin-oil, oil-in-water or as a bicontinuous phase, which is also called the surfactant phase. As used herein, the term "microemulsion means water-in-oil, oil-in-water or a bicontinuous phase, or mixtures thereof. Bicontinuous phase microemulsions are found to solubilize a high amount of 25 water and oil with lower levels of surfactant. The region around a bicontinuous phase microemulsion may transition into a swollen lamellar phase, otherwise known as a liquid crystal phase, and in certain cases these phases (microemulsion and liquid crystal) may co-exist. phases exhibit birefringence, shear induced (streaming)

- 3 -

birefringence, and are thixotropic, viscoelastic and transparent. Because some of these systems exhibit increased viscosity the technical literature may refer to them as microemulsion gels.

5

10

15

It is an object of the present invention to provide antiperspirant compositions, which contain high levels of antiperspirant salts, cosmetic oils and surfactants suitable for application to the axilla. It is also an object of the present invention to provide antiperspirant compositions that do not require refractive index matching of the aqueous and nonaqueous phases in order to be clear. It is also an object of the present invention to provide microemulsion antipersprirant compositions that require little energy to manufacture. These and other objects of the present invention will become more readily apparent in the present application.

Patents and patent documents, which are cited in connection with the disclosed invention, are as follows:

- 30 U.S. 5,487,887 discloses roll-on antiperspirant compositions and more particularly concerns antiperspirant

- 5 -

compositions which are clear and stable under varying temperature conditions and, when applied to the human skin, do not leave a visible white residue after drying. The compositions in the form of an oil-in-water microemulsion, comprise an antiperspirant active 5-30, PEG-7-glyceryl cocoate 5-25, emollients 0.5-3, cyclomethicone 3-7, and water 53-60%.

#### 10 Summary of the Invention

5

15

The invention relates to a composition in the form of a microemulsion comprising an antiperspirant salt, a cosmetic oil, and a combination of at least one cationic quaternary surfactant and at least one nonionic surfactant.

#### Detailed Description of the Invention

The present invention is directed to antiperspirant salt-containing microemulsions that are stable and clear liquids, or clear antiperspirant gels.

Stable clear microemulsions containing cosmetic oils,

25 antiperspirant salt, water, quaternary surfactants and
nonionic surfactants have been discovered. The
microemulsions are primarily composed of bicontinous phase
but the compositions include water-in-oil, oil-in-water, and
microemulsion gels (liquid crystals). The microemulsions

30 are novel antiperspirant compositions that can be used in
different types of applicators such as roll-on, sponge,

- 6 -

mousse, pad, wipe, brush, gel and aerosol or non-aerosol spray applicators.

The microemulsions discovered in this invention contain inorganic salts such as antiperspirant salts and cosmetic oils and the solubilization of high levels of both oil and aqueous solution of salts is achieved by incorporating combinations of a quaternary ammonium surfactant and a nonionic surfactant.

10

15

20

5

More specifically, the invention relates to a composition in the form of a microemulsion comprising an antiperspirant salt, cosmetic oils, and a combination of at least one cationic quaternary surfactant and at least one nonionic surfactant.

The invention also relates to a method for controlling or preventing underarm perspiration and malodor, which comprises applying to the underarm area a composition according to the invention.

The characteristics of the microemulsions of this invention include one or more of:

- The microemulsions exhibit stability over a relatively large range of temperature.
  - The viscosity ranges from a thick gel to a low viscosity sprayable liquid.
- The types of the microemulsions formed are dependent on the ratio of aqueous phase to the nonionic surfactant(s) and oil. When the percentage of the salt solution

- 7 -

containing quaternary surfactant increases, the microemulsion changes from water-in-oil to oil-in-water type, and a bicontinuous microemulsion phase, or possibly a liquid crystal phase, will form in-between.

- The microemulsions can contain a high level of inorganic salts.
  - The microemulsions contain a quaternary surfactant and a nonionic surfactant.
  - The microemulsions contain cosmetically acceptable oils.
- A method for controlling or preventing underarm perspiration and malodor, which can be applied to the underarm area.
  - The application of the microemulsions can be accomplished by using various product dispensers.

15

25

30

As used herein % means weight percent unless otherwise specified.

As used herein the term cationic surfactant means 20 quaternary ammonium surfactant.

The starting materials set forth herein are either known or can be prepared according to known methods. The compositions of the invention can be made by known methods or by methods that are analogous to known methods.

As used herein, microemulsions mean stable clear microemulsions containing cosmetic oil; antiperspirant salts, water and surfactants. The microemulsions described herein are primarily composed of bicontinous phase but the

- 8 -

compositions can include water-in-oil microemulsions. The compositions of the invention can also comprise a liquid crystal (that is, a microemulsion gel). More specifically, the compositions of the invention are selected from the group consisting of a microemulsion, a liquid crystal (that is, microemulsion gel), or a mixture of a microemulsion and a liquid crystal. The compositions of the invention comprise an antiperspirant salt, a cosmetic oil, and a combination of at least one cationic quaternary surfactant and at least one nonionic surfactant.

5

10

15

20

25

The compositions of the invention are novel antiperspirant compositions that can be used in different types of applicators such as roll-on, sponge, mousse, pad, brush, wipe, gel and aerosol or non-aerosol spray applicators.

All of the microemulsion compositions described contain antiperspirant salts and are clear and stable over a larger temperature range from room temperature to 45°C-50°C. The viscosity of some of the water-in-oil microemulsions are less than 10cst, therefore they are spray-able.

The invention relates to a composition in the form of a microemulsion comprising an antiperspirant salt, cosmetic oils, and a combination of at least one cationic quaternary surfactant and at least one nonionic surfactant.

A description of the ingredients included in the 30 compositions of the invention now follows.

- 9 -

#### Antiperspirant Salts

Antiperspirant salts contained in these microemulsions include, but are not limited to, aluminum chlorohydrate, aluminum dichlorohydrate, aluminum sesquichlorohydrate, aluminum chlorohydrex propylene glycol complex, aluminum dichlorohydrex propylene glycol complex, aluminum sesquichlorohydrex propylene glycol complex, aluminum chlorohydrex polyethylene glycol complex, aluminum dichlorohydrex polyethylene glycol complex, aluminum sesquichlorohydrex polyethylene glycol complex, aluminum zirconium trichlorohydrate, aluminum zirconium tetrachlorohydrate, aluminum zirconium pentachlorohydrate, aluminum zirconium octachlorohydrate, aluminum zirconium trichlorohydrex glycine complex, aluminum zirconium tetrachlorohydrex glycine complex, aluminum zirconium pentachlorohydrex glycine complex, aluminum zirconium octachlorohydrex glycine complex, aluminum chloride or buffered aluminum sulfate.

20

25

30

10

15

Antiperspirant actives for use herein are often selected from astringent active salts, including in particular aluminum, zirconium and mixed aluminum/zirconium salts, including both inorganic salts, salts with organic anions and complexes. Preferred astringent salts include aluminum, zirconium and aluminum/zirconium halides and halohydrate salts, such as chlorohydrates.

Aluminum halohydrates are usually defined by the general formula  $Al_2$  (OH)  $_xQ_y$  or a hydrate thereof in which Q represents chlorine, bromine or iodine, x is variable from 2

- 10 -

to 5 and x+y=6. The level of hydration is variable for example wherein there are up to about 6 or higher water molecules.

5 Zirconium actives can usually be represented by the empirical general formula: ZrO (OH) 2n-nzBz or a hydrate thereof in which z is a variable in the range of from 0.9 to 2.0 so that the value 2n-nz is zero or positive, n is the valence of B, and B is selected from the group consisting of chloride, other halide, sulphamate, sulfate and mixtures 10 thereof. Possible hydration to a variable extent is represented by wH2O. It is preferable that B represents chloride and the variable z lies in the range from 1.5 to 1.87. In practice, such zirconium salts are usually not 15 employed by themselves, but as a component of a combined aluminum and zirconium-based antiperspirant. The level of hydration is variable for example wherein there are up to about 6 or higher water molecules.

The above aluminum and zirconium salts may have coordinated and/or bound water in various quantities and/or may be present as polymeric species, mixtures or complexes. In particular, zirconium hydroxy salts often represent a range of salts having various amounts of the hydroxy group.

Zirconium aluminum chlorohydrate may be particularly preferred.

Antiperspirant complexes based on the above-mentioned astringent aluminum and/or zirconium salts can be employed. The complex often employs a compound with a carboxylate group, and advantageously this is an amino acid. Examples

30

- 11 -

of suitable amino acids include dl-tryptophan, dl- $\beta$ -phenylalanine, dl-valine, dl-methionine and  $\beta$ -alanine, and preferably glycine, which has the formula CH<sub>2</sub> (NH<sub>2</sub>) COOH.

Complexes of a combination of aluminum halohydrates and 5 zirconium chlorohydrates with or without with amino acids such as glycine can be employed in this invention. Certain of those Al/Zr-qlycine complexes are commonly called ZAG in the literature. Aluminum-Zirconium actives or ZAG actives generally contain aluminum, zirconium and chloride with an 10 Al/Zr ratio in a range from 2 to 10, especially 2 to 6, an Al/Cl ratio from 2.1 to 0.9. ZAG actives also contain a variable amount of glycine. In certain conditions, salts with an Al/Zr ratio greater than 2 (also known as lowzirconium actives) may be preferred. Actives of these 15 preferred types are available from Westwood, from Summit and from Reheis.

Other antiperspirant-salt actives that may be utilized include astringent titanium salts, for example those describe in GB 2299506A.

The proportion of solid antiperspirant salt in a composition normally includes the weight of any water of hydration and any complexing agent that may also be present in the solid active. However, when the salt is in solution, its weight excludes any water present.

25

The antiperspirant active will often provide from 1 to 60% by weight of the aqueous phase, particularly from 10% to 60% of the aqueous phase. The final content of the salts in

- 12 -

the formulations can range from 0.1% to 40% but 5-35% is preferred.

#### Other Aqueous Phase Ingredients

5

10

15

In addition to aluminum salts, the microemulsions, discovered in this invention, could solubilize aqueous solutions of monovalent, divalent and trivalent salts. The salts include sodium chloride, sodium sulfate, calcium chloride, calcium sulfate, magnesium chloride, aluminum sodium lactate, and mixtures thereof.

Other ingredients which can be dissolved in the aqueous phase include buffers, glycols, sugars, cyclodextrins, preservatives, antimicrobials, fragrances, chelating agents, amino acids, antimicrobials, anticholinergics, water-soluble polymers etc.

#### Water Content

20

25

The antiperspirant salts or other aqueous phase ingredients can be dissolved into water first and then combined with the non-aqueous phase. Water content in the final formulations can range from 1% to 60%, 5% to 30% is preferred and 10% to 25% is the most preferred.

#### Oil Phase

The oil phase of the compositions of the invention can 30 contain cosmetic oils such as esters, ethers, long chain alcohols or ethoxylated alcohols, hydrocarbons, fatty acids, - 13 -

monoglycerides, diglycerides or triglycerides, fragrances, volatile or non-volatile silicone fluids. Cholesterol and some other lipids can be incorporated with the oil phase to act as emollients. The oil phase concentration can range from 0% to 95%, but 20% to 60% is preferred.

Silicone fluids that may be included in compositions of the invention include volatile and non-volatile silicone fluids such as cyclomethicones and dimethicones.

10

5

Non-volatile silicones such as phenyl tris(trimethylsiloxy)silane can be included in compositions of the invention.

Silicone elastomers such as DC 9040, or DC 9010 by Dow Corning or GE SFE 839 by General Electric, can be included in the compositions of the invention.

Esters selected from the group consisting of cetyl

20 octanoate, C12 -15 alcohol benzoate, isostearyl benzoate,
diisopropyl adipate, isopropyl palmitate, isopropyl
myristate and mixtures thereof may be included in the
compositions of the invention.

25 Hydrocarbon oils such as aliphatic hydrocarbons

(Permethyl 102A <sup>TM</sup>, Permethyl 101<sup>TM</sup>); hydrogenated

polybutenes; hydrogenated polydecenes (Silkflo<sup>TM</sup>);

dioctylcyclohexane; mineral oil, cyclohexane and mixtures
thereof may be included in the compositions of the

invention.

- 14 -

#### Surfactants

#### Quaternary Ammonium Surfactants

5 Combinations of a cationic, quaternary ammonium surfactant(s) and a nonionic surfactant are employed in the compositions of the invention.

The quaternary surfactant in this invention is

essential, without which the formulation will be either
extremely sensitive to temperature or a microemulsion will
not form. The preferred cationic surfactants employed in
compositions of the invention are alkylamidopropyl
alkyldimonium quaternaries.

15

25

The preferred cationic quaternary surfactants have the following structure:-

$$/-(CH_2)_{x-}CH_3$$
  
20 R-CO-NH-(CH<sub>2</sub>)<sub>n</sub>-N<sup>+</sup>-(CH<sub>2</sub>)<sub>z</sub>-CH<sub>3</sub> A  
\( -(CH<sub>2</sub>)<sub>z</sub>-CH<sub>3</sub>

z is zero to three

- 15 -

with the proviso that  $x+y+z \le 6$ 

A is any physiologically acceptable counter ion which does not adversely affect the composition, and more specifically A can be selected from the group consisting of chloride, bromide, ethosulfate, methyl sulfate, lactate, acetate, nitrate or sulfate.

where R is a ricinoleic derivative:

10  $CH_3$  ( $CH_2$ )  $_5CH$  (OH)  $CH_2$ -CH=CH- ( $CH_2$ )  $_7$ -; or mixtures thereof.

15

20

Obviously, variations on this structure, known to the art, can also be incorporated into embodiments of this invention. The variations on surfactant structure should exhibit solubility in the aqueous antiperspirant salt solution. If the above mentioned solubility is maintained then variations in the quaternary ammonium salts can include but are not limited to, increasing or decreasing the alkyl chain length, changing the position or removal of the hydroxyl group, changing the position or removing completely the double bond or combinations thereof.

The most preferred quaternary surfactant is

25 ricinoleamidopropyl ethyldimonium ethosulfate a compound according to the formula above wherein n=3, x=1, y=0, z=0, A = ethosulfate and

 $R = CH_3 (CH_2)_{5}CH (OH) CH_2-CH=CH-(CH_2)_{7}-.$ 

The surfactant described just above is also known, under the following trade names, as Surfactol Q4 from

- 16 -

CasChem Inc., Lipoquat R from Lipo Chemicals or Mackernium DC-159 from McIntyre Chemical. Preferably the quaternary surfactant is supplied in a concentrated form (>90% active) with a low free amine content. This form is readily miscible with the aqueous antiperspirant-salt solution.

The quaternary surfactant(s) in the compositions of the invention range from 0.1% to 30%, where 2% to 15% is preferred.

10

15

20

25

30

5

#### Nonionic Surfactants

The nonionic surfactant or co-surfactants employed in the compositions of the invention can be polyethoxylated alcohol ethers or esters, polyglycerol mono or di-esters, glyceryl esters or branched guerbet ethoxylates or alcohols, or long chain carboxylic acids or combinations thereof. These compounds have a hydrophilic-lipophilic balance of between about 2 to about 15 and preferably less than about 12. Non-limiting examples are polyglycerol-3 diisostearate; glycerol oleate; poly glycerol-2 monoisostearate; polyglycerol -2 diisostearate, glyceryl isostearate. The most preferred ones are polyglyceryl-3 diisosterate, glyceryl isosterate and glycerol oleate or combinations thereof.

The ratio of cationic surfactant to aqueous phase containing antiperspirant salt ranges from 30/70 to 4/96, the ratio from 10/90 to 5/95 is preferred. The ratio of aqueous phase including salts, water and cationic surfactant

- 17 -

to nonionic surfactant is 90/10 to 70/30, and the ratio from 90/10 to 80/20 is preferred.

#### Formulation Examples

5

10

The following samples are stable for one month at room temperature. The particle size or domain length of these compositions are between about 150 to about 600 angstroms. All samples are clear. Some samples exhibit streaming birefringence. Some samples exhibit birefringence. The viscosity of these samples range from a thin liquid to a gel. These microemulsions are primarily composed of bicontinous phase but the compositions include water-in-oil, and microemulsion gels (liquid crystals).

15

The following formulation examples are illustrative of the invention.

The following is a general formula for an 20 antiperspirant microemulsion of the present invention.

25

\*Cosmetic additives or other optional ingredients can be added to either phase as required.

Generalized manufacturing procedure:

10 1. Weigh all the oil phase components into a suitable vessel and mix until homogenous. Heat may be used to expedite dispersion of components solid at room temperature.

- 2. The aqueous phase is prepared by mixing the quaternary ammonium surfactant with the antiperspirant salt solution.
- 3. Add the oil and water phases together and mix until a clear, homogenous dispersion is formed.
- 5 4. The microemulsion formulation is transferred into a suitable dispenser or applicator.

The following examples more fully illustrate embodiments of this invention, all percentages being by weight unless otherwise noted. The following specific examples, which are compositions of the invention, were made.

Compositions were prepared according to the following procedure:

15

10

- 1. Mix the cationic surfactant with the antiperspirant salt solution
- 2. Mix the nonionic surfactant with the oil mixture, then add the two mixtures together and mix well.
- 3. Heat may be applied to better dissolve solid nonionic surfactants, which are solid such as glyceryl oleate, in the oil phase prior to mixing the aqueous and nonaqueous phases

- 20 -

4.

10

The foregoing description and examples illustrate selected embodiments of the present invention. In light thereof, various modifications would be suggested to one skilled in the art, all of which are within the spirit and scope of this invention.

- 27 -

#### Claims:

5

- 1. A composition which is selected from the group consisting of a microemulsion, a liquid crystal, or a mixture of a microemulsion and a liquid crystal which comprises an antiperspirant salt, a cosmetic oil, and a combination of at least one cationic quaternary surfactant and at least one nonionic surfactant.
- 10 2. A composition in accordance with claim 1 characterised in that said antiperspirant salt is selected from the group consisting of aluminum, zirconium and mixed aluminum/zirconium salts.
- 15 3. A composition in accordance with claim 1 or 2 characterised in that said antiperspirant salt is a zirconium salt complexed with aluminum salts having coordinated or bound water.
- 20 4. A composition in accordance with any preceding claim characterised in that said antiperspirant salt is present in the aqueous phase at from about 1 to about 60%.
- 25 5. A composition in accordance with claim 4 characterised in that said antiperspirant salt is present in the aqueous phase at from 10% to about 60%.
- 6. A composition in accordance with any preceding claim
  30 characterised in that said aqueous phase further
  comprises a buffer, a glycol, a sugar, a cyclodextrin,

- 28 -

a preservative, an antimicrobial, a chelating agent, a water-soluble polymer, an anticholinergic, a monovalent salt, a divalent salt, a trivalent salt, fragrances or mixtures thereof.

5

7. A composition in accordance with any preceding claim cit said aqueous phase is present at about 1% to about 60%, more preferably at 5% to 30%, and most preferably at 10 to 25%.

10

15

25

30

- 8. A composition in accordance with any preceding claim characterised in that said cosmetic oil comprises esters, ethers, long chain alcohols or ethoxylated alcohols, hydrocarbons, fatty acids, monoglycerides, diglycerides triglycerides, fragrances and volatile or non-volatile silicone fluids, and cholesterol.
- A composition in accordance with claim 8 characterised in that said oil phase comprises silicone fluids which in turn comprise a volatile or non-volatile silicone such as cyclomethicone or dimethicone.
  - 10. A composition in accordance with claim 8 or 9 characterised in that said non-volatile silicone is phenyl tris(trimethylsiloxy)silane.
    - 11. A composition in accordance with claim 8 characterised in that said esters are selected from the group consisting of cetyl octanoate, C12 -15 alcohol benzoate, isostearyl benzoate, diisopropyl adipate and mixtures thereof.

- 29 -

- 12. A composition in accordance with claim 8 wherein said hydrocarbon fluids are selected from the group such as aliphatic hydrocarbons; hydrogenated polydecenes; hydrogenated polybutenes; dioctylcyclohexane; mineral oil, cyclohexane and mixtures thereof.
- 13. A composition in accordance with any preceding claim characterised in that the cationic quaternary ammonium surfactant has the following structure:

$$/-(CH_2)_{x-}CH_3$$
R-CO-NH- $(CH_2)_{n}-N^+-(CH_2)_{z}-CH_3$ 
 $^-(CH_2)_{z}-CH_3$ 

wherein n is one to six.

15 x is zero to three

5

y is zero to three

z is zero to three

with the proviso that  $x+y+z \le 6$ 

A is any physiologically acceptable counter ion which does not adversely affect the composition, and more specifically A can be selected from the group consisting of chloride, bromide, ethosulfate, methyl sulfate, lactate, acetate, nitrate or sulfate. where R is a ricinoleic derivative:

- 25  $CH_3$  ( $CH_2$ )  $_5CH$  (OH)  $CH_2$ -CH=CH- ( $CH_2$ )  $_7$ Or mixtures thereof.
- 14. A composition in accordance with claim 13 wherein n=3, x=1, y=0, z=0,  $A^-=$  ethosulfate and  $R=CH_3-(CH_2)_{5-}$ CH(OH)-CH<sub>2</sub>-CH=CH-(CH<sub>2</sub>)<sub>7</sub>-.

- 30 -

15. A composition in accordance with any preceding claim characterised in that said cationic quaternary ammonium surfactant is present at 0.1% to 30%, more preferably at 1% to 30%, most preferably at 2% to 15%.

5

16. A method for controlling or preventing underarm perspiration and malodor which comprises applying, to an underarm, an effective amount of a composition of claim 1.

(54) Title: ANTIPERSPIRANT COMPOSITIONS COMPRISING MICROEMULSIONS

(57) Abstract: Stable, clear, antiperspirant microemulsions containing cosmetic oils, antiperspirant salts, and water and combinations of cationic quaternary ammonium salt are provided. These microemulsions can be used in different types of applicators such as roll-on, sponge, mousse, pad, brush, gel and aerosol or non-aerosol spray applicators.
